1) YOUR superpowers and the skills you are learning (not only the professional ones)

I am thinking now of my superpower, and I think I will choose my social abilities and my adventure-pursuing will as some of my traits to start with. I love experiencing the world and the people, so I am very proactive when it comes to social interactions. This lust for interacting and adventure eventually led me to my first International volunteering camp. I realised that I could gain even more from such experiences if I would even further improve my communicational skills. How? That's how we come to my next skill set - languages. I absolutely love learning (and using them). I speak English almost fluently (I was preparing for the C1 certification), I learned German for 8 years during Middle and High school. I have basic knowledge in French and not so long ago I started learning Hungarian. Is it a superpower if I know the >>essential<< (we all know which those are) words in couple more European and Asian languages? Now to some professional powers. I am still a student on Bachelor's studies of Software Engineering, so I wouldn't be honest if I called those skills superpowers. I am quite good at solving problems, seeing and following patterns in a problem and in code. During my 3 years of studies I had a chance to work on multiple (more than 15) projects, both alone and in teams up to 4 members. I really enjoyed Object Oriented Programming courses in Java, C#, C++ and Python. This semester we finally learned something 'useful' or better to call it practical and it was in the course of Web Development in which we even had a project to create a Social Web App. I had to learn and use both front end - js/html/css/bootstrap and back end technologies - rest and Java. Also on my own I have done a Website for a local business. We had courses in AI principles, Databases, Algorithms etc.

2) Your passions (at work, in life)

As I have already mentioned, languages are one of my passions - as I like to call it a 'cultural' hobby. The hobby that I plan to make me earnings one day is Programming. And the third hobby, the one to keep my body fit and healthy would be - Hiking. I love nature, I love animals, mountains, grasslands, fresh air, warm sun on my face. Still haven't hiked in Austria, but I have been climbing over the Alps in Slovenia, one of the greatest experiences so far! I won't talk much longer here, since I have mentioned (maybe in the wrong-ish place) already my driving passions - being with people, being in international environments, volunteering, helping the community and society in general.

3) What you like about the project and how you relate to it personally

I have been in Ecological activism ever since High school. First I started by planting flowers and decorative plants in local park with my class master. Then we would organize spontaneous river's shore cleanings. But not until the graduation have I had the chance to combine this love for the Environment and the International community. In the summer of 2019, after I graduated I went to Germany on a ecological work camp where I learning about sustainable ways of living, organic food production and recycling at home. I fell in love even more with preserving the

nature, and thus our health. But not only that, I saw on myself that I love to be surrounded with people from different countries, of different nationalities and backgrounds. I enjoyed speaking in English, German and very bad French. Ever since I went on multiple such volunteerings, unfortunately because of COVID situation it was not that many as I would like. This project now combines my professional orientation - Software Developing - with the topic I care about. I really like the idea behind it and that you chose to address the problem at it's root - our food. Most of the waste comes from it. From producing, to transportation and preparing. On the professional side, I like the idea of working on an mobile app. I haven't done it before, but I was always interested in it. Also blockchain technology intrigues me. On one of our courses regarding SCADA systems, the teacher told us Blockchain is the future, everything will use it. I want to be in that future, while contributing to make it at least a bit greener.

Open question... What else should we know about you :-)

Hmm.. I think I have said quite a lot already, so I will give you some technical information. I would like to be an Intern for two months. I would love to be longer of course, but considering these problematic times, and also visa requirements this is the easiest and the most secure choice. I can apply for the Erasmus+ funding on my University. However, the application deadline is the 4th of March. I am fully vaccinated and completely thrilled while writing this. I really hope we will hear soon:)
